Goal/Vision

Provide a tool for pair programming and collaboration using live syncing of text, basic communication, and project file management. The overall goal of this project is to create a plain text editor for the manipulation of code over long distances. Rich text is not going to be handled except for a basic formatting for colored text that would make understanding project related files easier.

Key Features

- Text Editing
- Live document synchronization between one or more users
- Independent text based communication
- Minimalistic file management system
- Syntactic Highlighting for at least one programming language

Constraints

- Server/P2p network management
- API Access/Legality of use
- Limited Time
